

Halcyon Neuron Performance Manager

Solution Brief

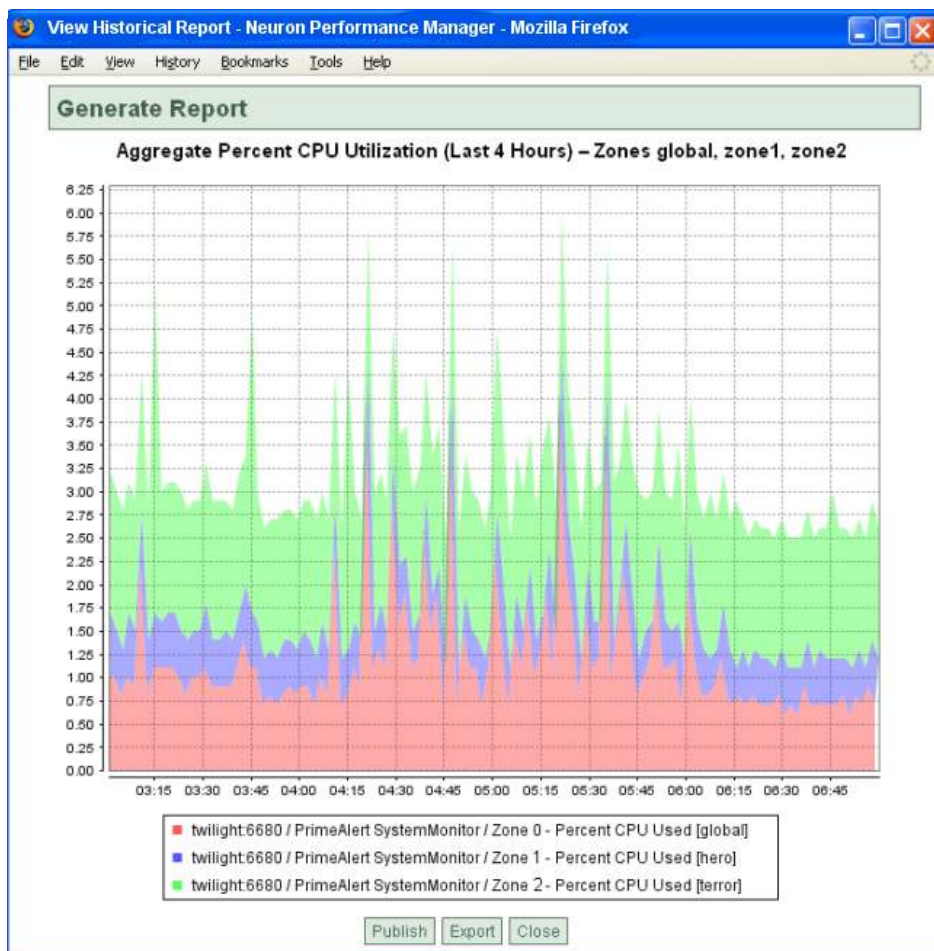

Overview

Neuron Performance Manager provides a comprehensive view of the health and performance of datacenter infrastructure useful for utilization monitoring, capacity planning, billing and chargeback. This solution enables enterprises to collect, store, and graph historical system and application performance data to improve service levels of critical business services.

Features

Neuron Performance Manager collects and stores performance data in a centralized repository that is acquired via Halcyon Neuron Agents or from third party data integration with popular systems management tools. This includes performance reporting for heterogeneous operating systems, databases, applications, storage and networking devices. The graphs generated instantly provide visual indicators for forecasting future capacity needs and troubleshooting performance bottlenecks.

Neuron Performance Manager enables users to schedule the import/export of data and provides automated email delivery of reports. It also features an easy to use web interface that allows users to quickly create and compare performance utilization across multiple hosts and provides the ability to aggregate data into a single graph useful for viewing overall system performance in virtualized environments.

Immediate Benefits

- ❖ Save time with scheduled automated delivery of reports to your email inbox
- ❖ Improve service levels with visibility to historical trends and performance bottlenecks
- ❖ Increase availability by predicting future capacity needs
- ❖ Reduce costs by integrating, consolidating, and aggregating data from multiple heterogeneous sources
- ❖ Investment protection through alignment with existing tools and processes
- ❖ Simplify report generation with customized report and graph templates

Learn More
